

Figure 4. Exposure-solve scenarios only

Warm-start native-JavaScript distributions from 20 isolated repeats; small dots are observations, large dots are medians, and thick bars are IQR.

Raw data include individual cold/warm observations plus load/network/module/compute/serialization/component fields. Warm medians range 1.08-6810.63 ms; cold medians range 1032.53-12004.90 ms.

Observed peak JS heap is reported where performance.memory is exposed; it is a stage-boundary sample rather than an OS process peak, and Firefox is unavailable.
